PROFILE

Frontend lead with 5+ years building real-time trading frontends in React and TypeScript for financial and energy-commodities markets. At Onyx Capital Group I led the greenfield rebuild of the Flux trading platform, built its real-time foundations solo and grew the frontend team from one to four. Before that, three years as a frontend consultant at CME Group on BrokerTec Quote, a multi-dealer RFQ platform for government bond repo. Used to owning requirements end to end where there is no BA or PM, and to working directly with trading desks.

SKILLS

Core: React, TypeScript, JavaScript, HTML, CSS

Real-Time & Data: WebSockets, TanStack Query, Zustand, Redux, RxJS, AG Grid

Charting: TradingView Advanced Charts, Lightweight Charts, Highcharts, Recharts

Tooling & UI: Vite, Webpack, TanStack Router, React Router, Next.js, Tailwind, shadcn/ui, Material UI, styled-components

Testing: Vitest, Jest, React Testing Library, Playwright, Cypress

Other: Claude Code (AI-assisted development, plan-first workflow), Node.js, PostgreSQL, Git/GitHub

WORK EXPERIENCE

Senior Frontend Engineer | Onyx Capital Group, London

Jan 2026 – Present

- Frontend lead for Flux, Onyx's energy-commodities trading platform, used by every trading desk on the floor across 800+ products (crude, gasoil, naphtha and more) and by 200+ external clients for prices, fair value and execution.
- Joined to maintain the legacy Create React App / Flux terminal. Within two months assessed the in-place upgrade path, made the technical case for a greenfield rebuild to the CTO and secured CEO and board approval.
- Designed the architecture and built the foundations solo (API and query layer, WebSocket handling for prices streaming every 100ms per product, tens of products on screen) while keeping the legacy platform running. Shipped Flux 4.0 to the whole floor four months after the green light.
- Delivered the core trading surface end to end: trading widget with limit and fill-or-kill orders, price ladder, live and historical order blotters, and an AG Grid Market Overview with live bid/mid/offer and hit/lift execution across all contracts.
- Built the charting layer: real-time candlesticks from streaming prices in TradingView Advanced Charts, with Lightweight Charts and Highcharts for open interest, positioning and volume analytics.
- Grew the frontend team from one to four engineers and lead it day to day: ticket planning, technical direction and the platform's business-domain knowledge. There is no BA or PM on the team, so I write the tickets the team picks up.

Coaching & Parental Leave | London

Nov 2024 – Dec 2025

- Took parental leave after the birth of my twin daughters.
- Founded and ran a private course teaching frontend engineers how to break into fintech: designed the curriculum and built the materials on React, TypeScript and real-time trading UIs. Wound it down after six months when the economics didn't work, and returned to the market.

Frontend Engineer | Adaptive Financial Consulting, consulting to CME Group

Sep 2021 – Oct 2024

- Built trading workflows from business requirements for BrokerTec Quote, CME Group's multi-dealer RFQ platform for government bond repo, as one of two senior frontend engineers on a global Agile team (React, TypeScript, Webpack; biweekly sprints, monthly releases).
- Handled hundreds of trades and price updates per second without degrading the UI, using RxJS, throttled WebSocket updates, Redux state tuned to avoid unnecessary re-renders, AG Grid virtualisation and memoised recalculations.
- Kept regressions out of monthly releases with Jest, React Testing Library, Playwright and Cypress suites, and met audit requirements with per-user action logging that let trades be traced end to end.

EDUCATION

BSc Computer Science | City St George's, University of London

2017 – 2020

PROJECTS

Crypto order book ([live](#), [GitHub](#)): real-time BTC/USDT ladder over the Binance WebSocket stream with a self-healing snapshot-plus-diff sync engine and slot/price keyed rendering. Built with Claude Code under a plan-first working agreement. Write-up: [Rows are slots, flashes are prices](#).
